

A subject is unsynced if it has never been synced with EDW.
It is stale if it hasn't been synced in the last x hours. If a user
has entered data before the first sync, we overwrite it but
save changes in pre_sync_data. Otherwise, we clobber.

Possible scenarios

1. EDW down
2. record not inserted in EDW yet
(nightly work)
3. local user only - pt will never be
in EDW (no medical record)
